20	30	40	50	60	70	80	90	100	110

The following table shows the results of the experiment. The first column shows the number of trials, and the second column shows the number of successes. The third column shows the probability of success, which is the number of successes divided by the number of trials. The fourth column shows the standard deviation of the probability of success, which is the square root of the probability of success multiplied by one minus the probability of success. The fifth column shows the 95% confidence interval for the probability of success, which is the probability of success plus or minus 1.96 times the standard deviation.

Trials	Successes	Probability	Standard Deviation	95% Confidence Interval

90	45	0.5	0.5	0.5 ± 0.5
100	50	0.5	0.5	0.5 ± 0.5

The results of the experiment show that the probability of success is 0.5. The standard deviation of the probability of success is 0.5. The 95% confidence interval for the probability of success is 0.5 ± 0.5. This means that we are 95% confident that the true probability of success is between 0 and 1.0. This is a very wide interval, which is due to the small number of trials. If we had more trials, the interval would be narrower.

The following table shows the results of the experiment. The data is presented in a table format with columns for time, distance, and speed. The values are as follows:

Time (s)	Distance (m)	Speed (m/s)
10	10	1.0
20	20	1.0
30	30	1.0
40	40	1.0

70	70	1.0
80	80	1.0
90	90	1.0
100	100	1.0

The results show that the speed remains constant at 1.0 m/s throughout the experiment. This indicates that the motion is uniform.
