May 22, 1985

R.L. MAGETTE COMPANY Box 149 Smithfield, VA 23430

ATTN: CARL KELLOGG

RE: Your P.O. #496

Dear Sir:

We hereby certify the following material provided to you on your above referenced order meets the minimum chemical and physical requirements of ASTM A120:

10.750" 0.D. X .365" WALL EW 18.000" 0.D. X .375" WALL EW EW PIPE PIPE

Thank you for your order.

Very truly yours, VALLEY STEEL PRODUCTS CO.

LR Mergel Geoffrey R. Mergel Quality Assurance Manager

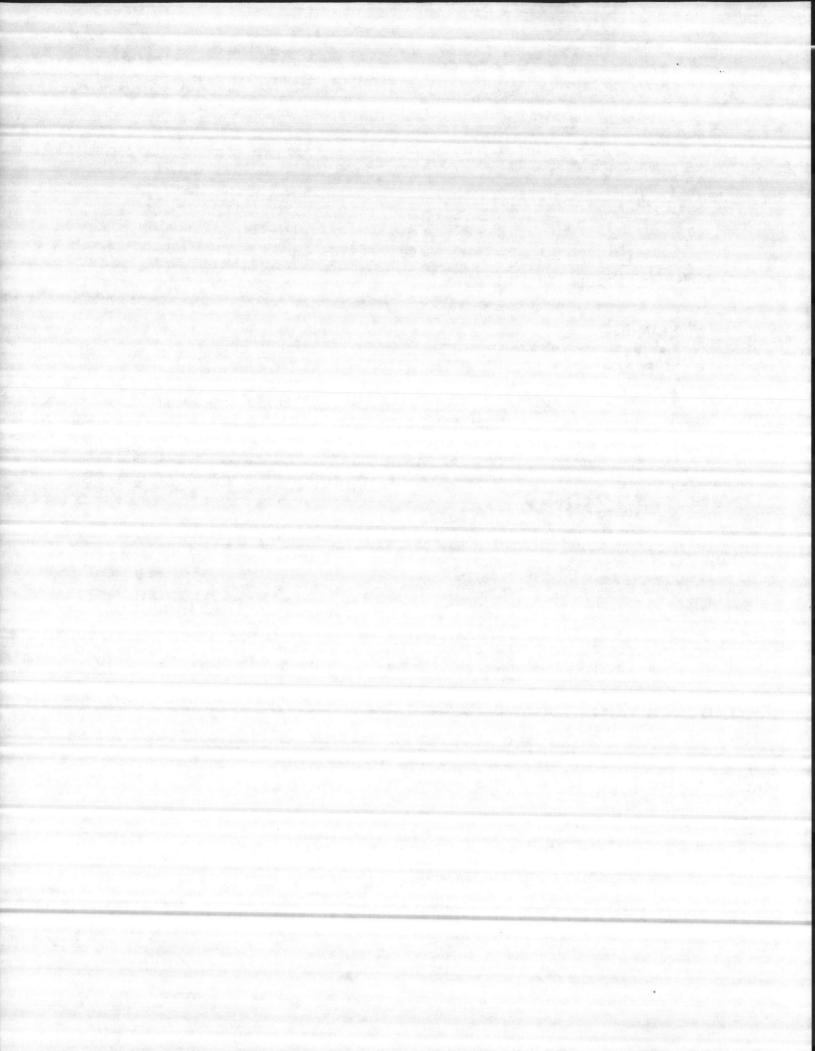

GRM: 15r

CITY OF ST. LOUIS) STATE OF MISSOURI) SS

CERTIFIED AND SUBSCRIBED BEFORE ME, A NOTARY PUBLIC IN AND FOR THE ABOVE CITY AND STATE, THIS DAY AND DATE.

DATED: 5-22-85

M. Landre CAROLYN M. LANDWEHR NOTARY PUBLIC

FCR

R. L. MAGETTE COMPANY

WATER SUPPLY CONTRACTORS DOMESTIC : INDUSTRIAL : MUNICIPAL Wells, Pumps and Community Water Systems

Serving Tidewater Virginia and Eastern North Carolina,

P. O. Box 908 Phone - 804 - 357-4105 Smithfield, Virginia 23430

To Whom It May Concern:

We hereby certify that the Well Screen will meet the following specifications:

Type 304 Stainless Steel. 10" inside diameter. Continuous slot wire wound type. Screen will have adequate strength to resist all external forces to which they are subjected, both during and after installation. Water velocity through the openings will not exceed 0.1 feet per second. Joints will be of the same material as the screen, either threaded or butt type welding rings.

Serving Tidewater Virginia and Eastern North Carolina

P. O. Box 908 Phone - 804 - 357-4105 Smithfield, Virginia 23430

To Whom It May Concern:

We hereby certify that the gravel meets the following specifications:

Clean, round, hard, water-worn quartz or granite with less than 5% felspar, no fossils, carbonate or orgamisms and of proper size and graduation to allow free flow of water in the well and prevent the infiltration of sand. Gravel size will be selected by the government, based upon the analysis of the sand in the water bearing stratts. Gravel will be sterilized with hypochlorite before using.

		NOTE

NOTE

Specify pump serial number when ordering replacement parts. This will be found on the nameplate attached to the discharge head casting or to the bowl assembly.

WELL

Measure the well to make sure it is of ample size and depth to receive the pump. The well must be sufficiently straight to allow the pump to hang freely with no misalignment.

FOUNDATION

A concrete foundation should be constructed before the pump is installed to permit aligning the pump head with the well while lifting equipment is available. Provide an opening in the foundation large enough for the top column flange with ample clearance. If the well is out of plumb, the pump head must be placed so that the drive shaft will be on the same inclination as the well casing. This is important. The foundation should be large enough to carry the weight of the pump without settling.

TOOLS

The following tools and equipment are required for satisfactory installation:

Derrick, gin pole with chain hoist, winch truck, well rig or similar equipment with at least 12 foot clearance (more for long bowl assemblies) and sufficient capacity to safely handle the weight of the complete unit.

Two pipe clamps or pipe elevators of proper size for pump column.

Two chain pipe tongs (if column has screwed couplings).

Two small pipe wrenches for screwing shaft together.

Small tools including wire brush, three-cornered file, wrenches, can of pipe compound, etc.

PREPARATION

Immediately on receipt of pump check carefully with packing list. Report any loss or damage to transportation company and to factory. Keep all parts in good dry storage. When ready to install, unpack material and lay out on skids or boxes near well.

Place the column pipe with the coupling end toward the well. Check shafts for straightness. Roll on ways if any question as shafts must be almost perfectly straight. Place a shaft inside each length of column with the bearing sleeve toward the well. Screw a shaft coupling on the opposite end.

Note — Short-coupled turbine pumps are usually shipped assembled except for mounting motor. To install these pumps it is only necessary to raise the pump over the sump or reservoir and lower it on foundation. Then mount motor or drive as explained later.

IMPORTANT NOTES

- Column pipe threads are right hand; shaft threads are left hand.
- Protect all parts from dirt; especially column and shaft threads, couplings, and all machined surfaces. Any dirt or foreign material between

ends of shafts or other parts may cause misalignment and unsatisfactory operation.

- 3. Handle shaft with extreme care to avoid bending.
- 4. All shaft and column must butt solidly in couplings; otherwise, differences in length may develop during installation. Ends of shafts should be even with small hole in side of shaft coupling.

INSTALLING BOWL ASSEMBLY

If headroom permits, screw strainer on suction pipe and suction pipe into bowl assembly before raising bowl assembly from ground. Where headroom is limited or assembly is long, lower suction pipe into well with strainer attached and hold with clamp. Then if headroom permits, assemble the bottom section of shaft, and column pipe on the top of the bowl assembly. Raise the complete assembly, taking particular care not to place too much strain on the bowls, and screw the bowl assembly on the suction pipe. If necessary to place clamp on bowl assembly, make sure this is located over joint and not on the shell of a bowl.

Loosen clamp on suction pipe and lower assembly into the well until the upper clamp or elevator rests on top of casing or foundation.

INSTALLING COLUMN

Place clamp or elevator under coupling on upper end of the bottom section of column and raise over the well. Support the shaft by hand or with a rope sling, taking particular care not to bend the shaft. On larger pumps a small clamp to fit the shaft or a length of manila rope will assist in supporting the shaft. Carry the lower end of the column or slide it on a plank so as not to damage threads. Make sure all threads are perfectly clean. Paint outside pipe threads with a good thread lubricant. Oil shaft threads and wipe off excess oil.

Screw the bottom shaft into the impeller shaft coupling and tighten. Then screw the column into the column adapter or if the adapter is flanged, bolt it to the top bowl. Lower the complete assembly into the well and hold with clamp.

Place a bearing assembly over the shaft with the snap ring at the top and slip it firmly in place in the column coupling.

Repeat this procedure until all of the column has been installed. Each section must butt rigidly in the couplings. Intermediate column lengths are regularly 10 feet for pumps up to 2200 RPM and 5 feet for pumps to operate over 2200 RPM. Rubber bearing should center in bearing sleeve in each column coupling. The top section of column has a flange for attaching to the discharge head. The top shaft which goes through the stuffing box is regularly of stainless steel, several inches longer than the top pipe.

INSTALLING HEAD ASSEMBLY

Hold the pump with clamps under the upper column coupling. This will support the top column flange several feet above the foundation where it is convenient to attach the discharge head. Remove the stuffing box assembly from the head. It may be necessary ro bump it lightly with a wooden block. Place a double chain sling through the head and raise it over the pump. Make sure flange on lower side of head is clean and that studs are not damaged. Clean the top column flange and place paper gasket on it. Line up studs and the opening through the head with holes in top flange and lower the head carefully onto the top flange. Make sure the register fits and tighten stud nuts securely.

Then raise the complete pump assembly and remove the clamps. Rotate the unit until the discharge flange is in the desired direction and lower onto foundation. If the head does not rest evenly on the foundation, lift the unit and place metal shims under each corner. The head must be supported on the foundation so that it is in line with the column and shaft. Never level a pump head on the foundation with a spirit level.

Place paper gasket over stuffing box studs. Make sure the flange is clean and lower the stuffing box over the shaft using care not to damage packing. Tighten stud nuts securely and tighten gland nuts finger tight. Run stuffing box relief tube down through opening in head to return by-pass water to well; or place tube through drain opening in back of head and pipe to drain. If pump is to operate under pressure; leave relief valve partially open to relieve the pressure on the upper packing. Give grease cup several turns to lubricate packing and stuffing box bearing. Screw headshaft coupling on upper end of stuffing box shaft. Place a cloth over coupling to avoid any possibility of dirt or foreign material dropping into it while motor is being mounted.

INSTALLING MOTOR OR DRIVE

Check motor nameplate to make sure it is suitable for the electric current available and the proper speed for the pump. Use eye bolts in top of motor for lifting motor only. Do not use these eye bolts for lifting motor and pump together. Set motor on pump head making sure that base of motor and top of head are clean and that register fits properly. Bolt motor in place with bolts or cap screws furnished. Remove motor canopy and top drive coupling. Lower headshaft through hollow-shaft of motor with end of shaft having keyway at the top. Tighten in headshaft coupling. It is important that shafts butt in coupling but do not use excessive force which might cause misalignment.

ALIGNING PUMP

Check alignment of pump head on foundation by noting the clearance around the headshaft at top of motor. If the headshaft stands to one side in hollow-shaft, place metal shims between the head and foundation on the opposite side so that the headshaft will stand exactly in the center. The straightness of the headshaft, stuffing box shaft and coupling may be

checked by installing the top drive coupling, raising the impellers and turning the rotating assembly 180°. Then remove the top drive coupling and the shaft should remain in the center of the hollowshaft. Raise the complete pump assembly and without moving the shims, spread a layer of cement on the foundation. Then let the pump down until it rests in exactly the same position as before. Recheck position of top shaft. After cement sets tighten foundation bolts.

CHECKING ROTATION

Have the motor wired and check rotation before installing the top drive coupling. Rotation must be counter-clockwise when looking at top of motor. (See arrow on pump head.) Motors with built-in non-reverse ratchet may be energized momentarily without injury to the ratchet assembly. If rotation is incorrect, reverse two leads on three phase motor. Refer to diagram on single phase motor.

ADJUSTING IMPELLERS

Place top drive coupling over shaft and insert gib key. Tighten adjusting nut until impellers are raised off bowl seats and shaft just turns freely by hand. Then raise approximately one-half turn for each 100 feet of setting. It is better to raise more than necessary for starting and then make closer adjustment gradually. Install lock screw and tighten before starting pump. For maximum performance, impellers should be adjusted so that they run as close as possible and yet do not rub at maximum pressure. If there is any unusual noise or vibration, stop the pump and recheck impeller adjustment. A watt meter or ammeter may be used to obtain very close adjustment. If well may contain sand, raise impellers about twice normal amount when first starting pump and then readjust after well has cleared If the well does not produce sufficient water to supply the pump, the capacity of the pump should be reduced by raising the impellers.

PRELUBRICATING AND STARTING PUMP

Before starting deep well pumps the Cutless Rubber bearings above the static water level must be prelubricated with water. Connect pre-lube tank to opening in stuffing box assembly with fittings provided and fill tank with clean water. Allow at least half the tank of water to run down the shaft before starting pump. Then leave valve open and allow pre-lube water to continue to flow until the water from the pump reaches the surface. Allow tank to refill before closing valve. On large pumps with deep static water level refill tank from another source to provide ample prelubrication while the pump is coming up to speed. If such pumps are to be operated manually, it may be more convenient to install a 30 or 50 gallon barrel for prelubrication.

Pumps discharging into pressure systems are normally prelubricated by connecting a line around the check valve and installing the globe valve in this line. A small "V" groove should be filed in the valve seat so that the valve cannot be closed accidentally. Four to five gallons of water per hour is generally sufficient

• •

to keep the bearings moist and in condition for automatic operation. Where pumps operate frequently and the water level is less than 50 feet from the surface, the bearings will normally remain sufficiently moist for smooth starting without prelubrication. Where pumps are started infrequently or the amount of water available for prelubrication is limited or on large installations to be operated automatically an electric solenoid operated valve should be installed in the pre-lube line with a timing relay to delay the starting of the pump until the bearings have been properly lubricated.

A gate valve should be placed in the discharge line. Leave this valve about three quarter closed when the pump is started. After the water reaches the surface, open the valve slowly to avoid over pumping the well and to maintain normal discharge pressure on the pump. Check the stuffing box and tighten gland, if necessary, with a small wrench, until there is only a small trickle of water to keep the packing lubricated.

LUBRICATION

PUMP LINE SHAFT AND BOWL BEARINGS

On Fig. 4700 Water Lubricated Pumps all bearings below ground are lubricated by the water flowing through the pump. Prelubrication during the starting period should be provided where necessary as explained on Page 4.

The water level in the well should be checked occasionally while the pump is in operation. If the water level draws down below the bowls, additional column and shaft should be installed, or the capacity of the pump should be reduced by either raising the impellers or throttling the discharge. The pump must not be allowed to operate if the water level drops to the strainer and the pump breaks suction.

STUFFING BOX

Apply a small amount of a good water resistant lubricant to the grease fitting on the stuffing box each time the pump is started or once a day if the pump is operated continously. Special turbine stuffing box grease may be obtained from Deming Division, Crane Co. in 1 lb. cans. If necessary, an automotive water pump grease may be used.

MOTOR WITH GREASE LUBRICATED BEARINGS (Lubricated at factory before shipment)

 Motor with grease fitting and drain plug in each bearing housing.

Once each six months or once a year, depending on operating conditions, the motor should be relubricated as follows:

1. Remove drain plug or grease ejector.

Apply pressure gun to grease fitting and inject new grease until all old grease has been forced out of the bearing through the grease drain. If a grease ejector is supplied, assist flushing of old grease by slowly working the

plunger back and forth several times to remove grease from the drain.

- Run motor for approximately five minutes to relieve bearing of excess grease using ejector immediately upon starting to assist removal of grease from drain.
- 4. Replace drain plug or ejector.
- B. Motor with grease fitting only in each bearing housing.

Once each six months or once a year, depending upon operating conditions, add a small amount of grease. Then remove grease fitting and operate the motor about one-half hour before replacing the fitting to allow any excess grease to be expelled. The bearing may run warm (without injury) until the excess grease has been expelled. An approval motor bearing grease may be obtained from Deming Division, Crane Co., in 1 lb. cans.

MOTOR WITH OIL LUBRICATED BEARINGS, BELT DRIVE OR FLEXIBLE COUPLING DRIVE (Fill with oil before starting)

Oil lubricated motors and drives are shipped without oil and should be filled with proper grade oil before starting. Check oil level once a week with pump idle. Change oil once a year or every 2000 hours operation, whichever occurs first. Change oil more frequently for continuous operation or under dusty conditions. For proper turbine oils refer to table. While special turbine motor oil is preferred, if necessary a SAE10 or SAE20 non-detergent pure paraffin base motor oil may be used temporarily.

MOTOR WITH OIL LUBRICATED TOP BEARING AND GREASE LUBRICATED LOWER BEARING

(Fill top oil reservoir before starting. Lower bearing greased at factory.)

Relubricate according to instructions outlined above.

RIGHT ANGLE DRIVE (Fill before starting)

Refer to manufacturer's instructions which usually recommend changing oil once a year or after 2000 hours of operation, whichever occurs first. Use only an approved turbine oil as recommended by the drive manufacturer; SAE automotive oils are Not satisfactory for Right Angle Drives.

NOTE

See Page 6 for list of recommended oils and greases for motors.

CAUTION

Due to the high speed at which the smaller size units may operate, and since most of the pumping unit is underground, extreme care must be used in assembling and installing it and thoroughly checking the entire installation before it is put into operation.

If, after the well has been drilled and cased, it is crooked, the water supply is doubtful, the water level has dropped, or the water contains considerable sand, gravel or gas, the Crane Deming sales office from whom the unit was purchased should be consulted before it is started.

Under no circumstances will the Company guarantee the pump against the effects of corrosion, erosion or electrolytic action, those being entirely beyond the control of the Company.

In case any unusual vibration appears when starting the unit, or if vibration develops later, the unit should not be continued in operation, but Crane-Deming or authorized representative, should be requested to service the installation to place it in proper running condition.

If the above instructions are not followed or if the pump is operated without the proper submergence recommended by the Company, all guarantees are withdrawn and Crane-Deming will not assume any responsibility for the proper operation of the unit or the life of any of its parts.

LIMITED WARRANTY

APPLICABLE ONLY TO CONSUMER SALES

Crane Co., Deming Division gives a limited one-year warranty on the machinery of its own manufacture sold herewith. Crane Co., Deming Division warrants to any buyer or consumer that the machinery shall be free of defects in material and workmanship during normal use and service for a period of one year from the date of shipment.

Under this limited warranty, Crane Co., Deming Division shall, within 45 days from the date of notification, (1) repair the product at the factory or the nearest point of repair OR, (2) replace the product or any parts proven defective in material or workmanship OR, (3) refund the purchase price. The choice of such remedies shall be at the sole discretion of Crane Co., Deming Division.

This written warranty is the only warranty made by Crane Co., Deming Division. IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE, IF ANY, ARE LIMITED TO THE SAME TERM AS THIS WRITTEN WARRANTY. SOME STATES DO NOT ALLOW LIMITATIONS ON HOW LONG AN IMPLIED WARRANTY LASTS, SO THE ABOVE LIMITATION MAY NOT APPLY TO YOU.

HOWEVER, SOLELY WITH RESPECT TO A BUYER WHO IS NOT A CONSUMER, THE FOREGOING WARRANTY IS IN LIEU OF ANY AND ALL IMPLIED WARRANTIES, INCLUDING WITHOUT LIMITATION, IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR ANY PARTICULAR PURPOSE AND IN LIEU OF ALL OTHER WARRANTIES EXPRESS OR IMPLIED, AND NO OTHER WARRANTY IS MADE OR AUTHORIZED TO BE MADE.

The buyer or consumer must promptly and within the applicable limited warranty period notify the installing dealer or contractor in writing of any defect in the machinery and shall permit Crane Co., Deming Division to inspect the product so that it may determine its obligations under the warranty. The buyer or consumer must pay all labor costs, freight charges to the factory or the nearest point of repair, if any, and any charges for the installation of replacement parts, incurred by the Dealer, Contractor or this Company. Upon settlement of its obligations, if any, under this warranty, Crane Co., Deming Division, at its option, shall be entitled to the return of the defective product or part (s) (transportation prepaid).

This limited warranty does not cover unsatisfactory performance or failure due to misuse or abuse of the product, nor will Crane Co., Deming Division be responsible for unsatisfactory performance or failure due to improper installation, adjustment or repair of the product. The specifications for the machinery are descriptive and are not warranties.

This limited warranty does not cover equipment and accessories manufactured by third parties.

CRANE CO., DEMING DIVISION IS NOT RESPONSIBLE FOR CONSEQUENTIAL, SPECIAL, CONTINGENT, INCIDENTAL OR ANY OTHER DAMAGES WHATSOEVER IN CONNECTION WITH REPLACEMENT, REPAIR OR REFUND AS SET FORTH ABOVE. SOME STATES DO NOT ALLOW THE EXCLUSION OR LIMITATION OF INCIDENTAL OR CONSEQUENTIAL DAMAGES, SO THE ABOVE LIMITATION OR EXCLUSION MAY NOT APPLY TO YOU.

THIS WARRANTY GIVES YOU SPECIFIC LEGAL RIGHTS, AND YOU MAY ALSO HAVE OTHER RIGHTS WHICH MAY VARY FROM STATE TO STATE.

CRANE CO., DEMING DIVISION 884 South Broadway Salem, Ohio 44460

Form 167 - JANUARY 2, 1977

Printed in U.S.A.

WARRANTY

APPLICABLE WHEN THE MACHINERY IS SOLD AND INSTALLED ON A COMMERCIAL OR INDUSTRIAL APPLICATION, AND NOT AS A CONSUMER PRODUCT.

INDUSTRIAL PUMPS CRANE CO., DEMING DIVISION SALEM, OHIO, 44460

The following warranty, which is not a consumer warranty, is made in lieu of any and all implied or express warranties including, without limitation, implied warranties of merchantability and fitness for a particular purpose and no other warranty is made or authorized to be made.

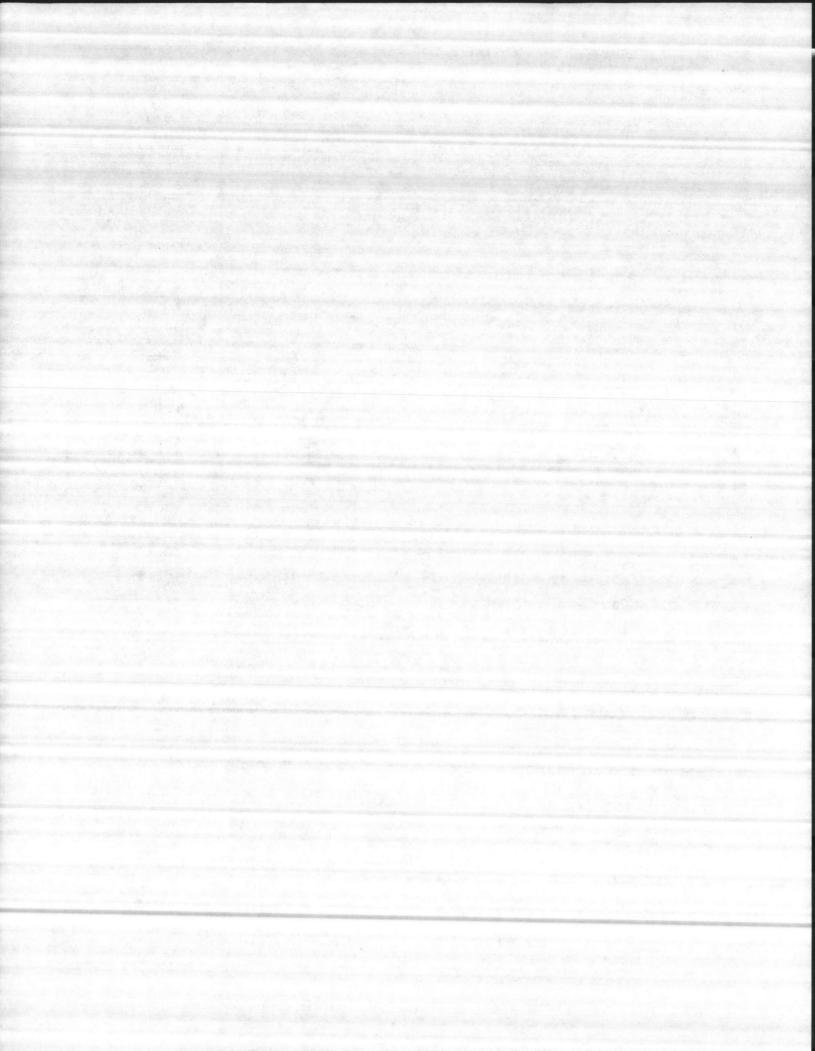

Service under this warranty is the responsibility of the installing dealer or contractor. In the event service is required, the Buyer should request such service directly from the installing dealer or contractor. If for any reason the installing dealer or contractor is unknown or cannot be located, the Buyer should write Crane., Deming Division for the name and address of the nearest dealer or contractor.

If within one (1) year following date of delivery, any material supplied by Crane Co. hereunder proves defective or fails to meet the agreed specifications, Buyer shall not return it unless requested to do so but shall immediately notify the installing dealer or contractor, stating full particulars in support of his claim and if faulty workmanship or material is involved, or if material fails to meet the agreed specifications, Crane Co. will adjust the matter fairly and promptly. Under no circumstances shall Crane Co. be obligated to allow claims for subsequent or consequential damages or for any labor expense incurred by reason of the use or sale of any material which is defective or fails to meet the agreed specifications. The sole measure of damages shall be the price received therefore by Crane Co.

ORILLING HUID PRODUCT QUIK-GEL®

Ttem# 10 Parer 2.1.7

Viscosifier

QUIK-GEL® viscosifier is a finely ground, premium-grade western sodium bentonite, specially processed to promote ease of mixing and superior mudmaking qualities in fresh water.

Recommended Uses

In Fresh Water or in Freshwater-based Drilling

Increasing hole-cleaning capabilities.

Forming on permeable sections of the well bore a thin filter cake that can be removed easily by backflushing.

Promoting hole stability in poorly consolidated and caving formations.

Reducing water seepage in permeable formations.

Avoiding or overcoming loss of circulation. In Fresh Water

Making an economical, single-sack, low-solids drilling fluid.

.Making gel-foam for air drilling.

Major Advantages

Effectiveness. QUIK-GEL® viscosifier makes more than twice as much mud of the same viscosity as an equal weight of API-standard bentonite.

Fast yield. QUIK-GEL reaches high viscosity quickly.

Easy mixing. QUIK-GEL viscosifier saves time and effort in making mud.

Convenience. The 50-pound (22.7 kg) bag is easy to nandle.

Enviornmental acceptability. QUIK-GEL is not toxic and does not ferment.

Recommended Treatment

See table.

Approximate Amounts of QUIK-GEL® Viscosifier Added to Fresh Water or to Freshwater Drilling Fluids

	Thining Fluids			
Under normal drilling conditions.	lb/100 gal Added to Fresh Wate	lb/bbl	kg/m³	
To stop loss of circulation.	15-25 25-40 35-45	6-11 12-18	15-30 35-50	
To improve performance: for better hole cleaning, thinner filter cake, and increased hole stability.	Added to Freshwater	40-55		
Method of addition. Preferably min by the	5-10	2-5	6-14	

Method of addition. Preferably, mix by adding slowly through a jet mixer or high-speed stirrer. If such mixing equipment is not available, sift QUIK-GEL slowly into the liquid close to the pump suction while circulating.

Packaging

QUIK-GEL® is packaged in multiwall, water-resistant paper bags containing 50 pounds (22.7 kg).

4 Ply - Paper - I ply plastic

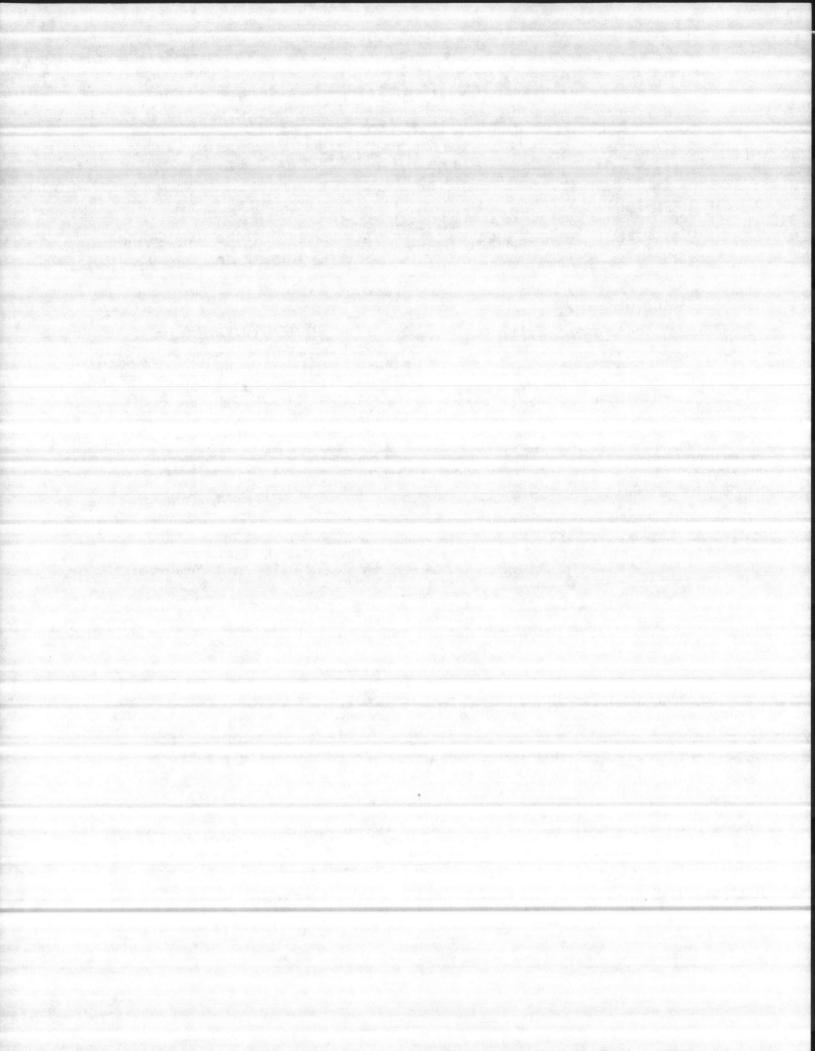

OUIK-GEL is a registered trademark of NL Industries In

Availability

QUIK-GEL® viscosifier may be purchased through any NL Baroid Service Center or from the Houston plant.

Act

1

demonstration of test reliability. This demonstrates that their test precision and accuracy are equivalent to the norm established by major laboratories in the industry who routinely run these tests.
e. The values furnished for each property

do not represent absolute value, but rather the values that should be obtained when precisely following the test procedures in API Spec 13A, Section 2. The test calibration barite should be run alongside any sample in dispute using the same equipment and technician.

SECTION 3 BENTONITE

- 3.1 Physical and Chemical Requirements. Bentonite furnished to this specification shall conform to the physical and chemical requirements of Table 3.1.
- 3.2 Testing Procedures. The requirements given in Table 3.1 shall be determined by the following testing procedures.
 - 3.3 Apparatus.
 - a. Laboratory Balance-Sensitivity 0.01 g.
 - b. Mixer 11,000 ±300 rpm under load, with single corrugated impeller approximately 1 in. (2.5 cm) in diameter (e.g., Multimixer Model 9B with 9B29 impeller).
 - c. Container 7 in. (18 cm) deep, 311 in. (9.7 cm) ID top, 2% in. (7.0 cm) ID bottom (e.g., Hamilton Beach mixer cup No. M110-D).
 - d. Direct-Indicating Viscometer as described in API RP 13B.
 - Filter Press as described in API RP 13B.
 - f. Oven 220 ±5 F (105 ±3 C).
 - g. Sieve U. S. Standard No. 200.

TABLE 3.1 BENTONITE PHYSICAL AND CHEMICAL REQUIREMENTS.

See Par. 3.2 through 3.6, Std 13A and Par. 2.7 through 2.10, RP 13B for testing procedures

	2			
Requirements	Numerical Values			
Requirements Suspension Properties* Viscometer Dial Reading at 600 rpm	30, minimum**3 × Plastic Viscosity, maximum15.0 cm*, maximum4.0 per cent maximum10 per cent maximum			

eViscometer reading, yield point, and filtrate are measured on a suspension of 22.5 g bentonite in 350 cm² of distilled water (22.5 lb./bbl. or 64.2 kg per m²). Filtrate measurement and viscometer reading shall be taken at a temperature of 75±5F (24±3C).

**The requirements of Table 3.1 result in a minimum yield of approximately 91 bbl. of 15 cp mud per ton of bentonite.

†Sieve designation as per ASTME11: Sieves for Testing Purposes, available from American Society for Testing Materials, 1916 Race St., Philadelphia, Pa. 19103.

3.4 Suspension Properties.

- a. Prepare a suspension of the bentonite sample using 22.5 g of clay (as received) per 350 cm³ of distilled water. Sift the clay into the water while stirring on the mixer. Stir for 20 minutes. If the moisture content of the clay as received exceeds 10 per cent by weight, take such weight of clay as is equivalent to 22.5 g of clay containing 10 per cent moisture.
- b. Store the suspension approximately 16 hours (overnight) in a sealed container at room temperature.
- c. Stir the suspension for 5 minutes in the apparatus defined in Par. 3.3. On the directindicating viscometer note the dial readings at 300 and 600 rpm and at a temperature of 75±5F (24±3C). Calculate the plastic viscosity and yield point.
- d. Determine filtrate of the suspension at 75±5F (24±3C) as described in API RP 13B.

3.5 Wet Screen Analysis.

a. Weigh approximately 10 g of bentonite to ±0.01 g. Add the weighed sample to 350 cm³ of water containing 0.2 g of neutral phosphate, such as sodium tetraphosphate. Stir on the mixer for 30 minutes. Age a minimum of 2 hours. Stir 5 minutes on the mixer.

b. Transfer the sample to a U.S. Standard No. 200 sieve having a diameter of 3 inches (7.6 cm) and a depth of 2.5 inches (6.3 cm) from the top of the frame to the wire cloth. Wash the material on the screen with water at 10 psig (0.70 kgf per cm²) from a spray nozzle (e.g., Spraying Systems Company No. TG 6.5 tip with ¼ T body) for 2 minutes. While washing, allow the elbow bend of the nozzle to rest on the rim of the sieve and move the spray of water repeatedly over the surb. Transfer the sample to a U.S. Standard the spray of water repeatedly over the surface of the screen. Transfer the residue from the screen to a tared evaporating dish.

e. Dry the residue in the oven and weigh to ±0.01 g.

Weight Residue × 100 Per cent Residue = Weight Sample

3.6 Moisture.

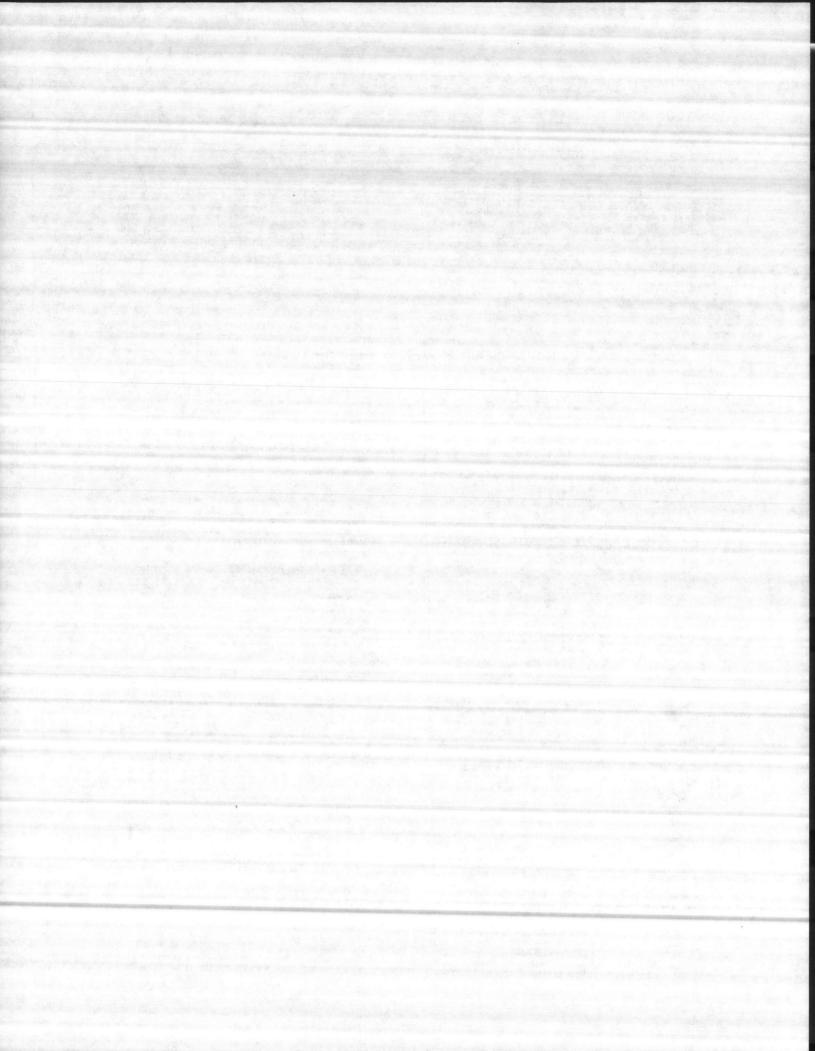

a. Weigh approximately 10 g of bentonite to ±0.01 g.

b. Dry to a constant weight at a temperature of 220 ±5 F (105 ±3 C).

c. Cool the sample in a desiccator and weigh.

Weight Original Sample Per cent Moisture = Weight Original Sample × 100

201.

RE: N62470-81-C-1644
Expansion of Holcomb Blvd.
Water Treatment Plant
Camp Lejeune, NC 28542
Well #1

Gentlemen:

We are enclosing six (6) copies of the Driller's Log, Electric Log, Gamma Log, Water Analysis and Sieve Analysis for your review. The test well was drilled at 250'. Water samples were taken at the 90' level.

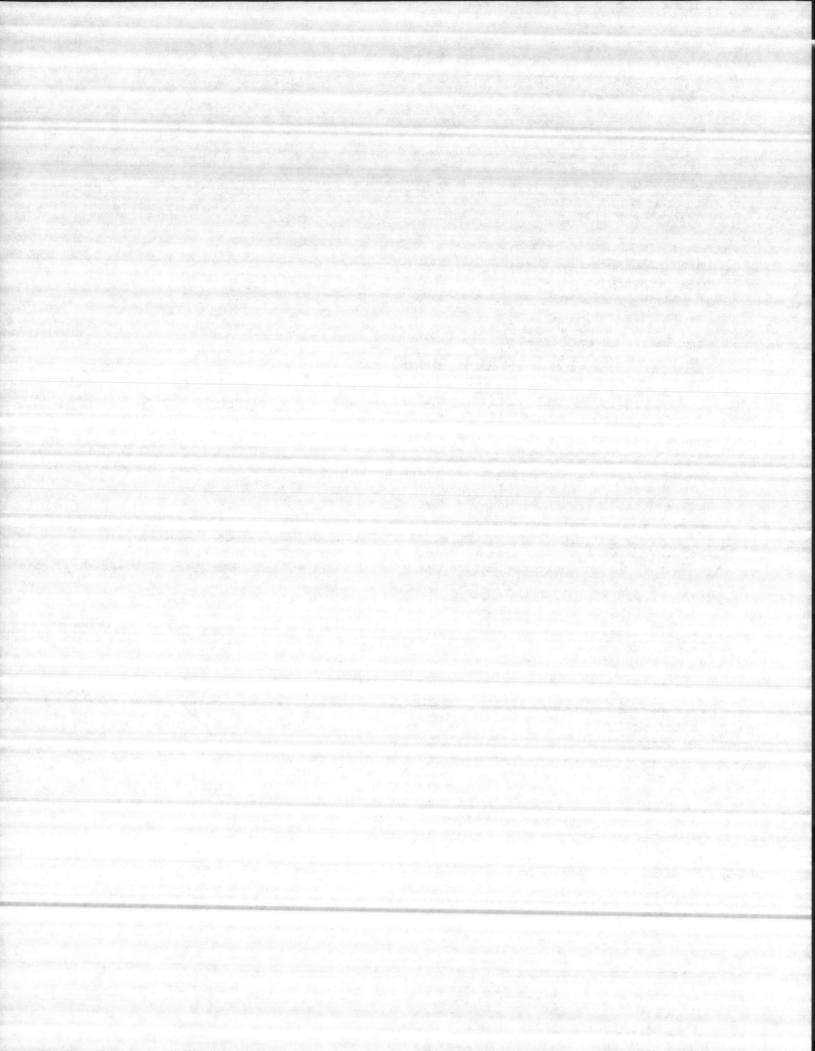

We recommend a line of .30-slot stainless steel screen set at the 78' to 98' level for a total of 20 VF of screen. The gravel pack recommended is 8-12. It is our best estimate that this well may yeild 260 GPM.

Please review the data and advise if we are to proceed with developing a permanent well at this site.

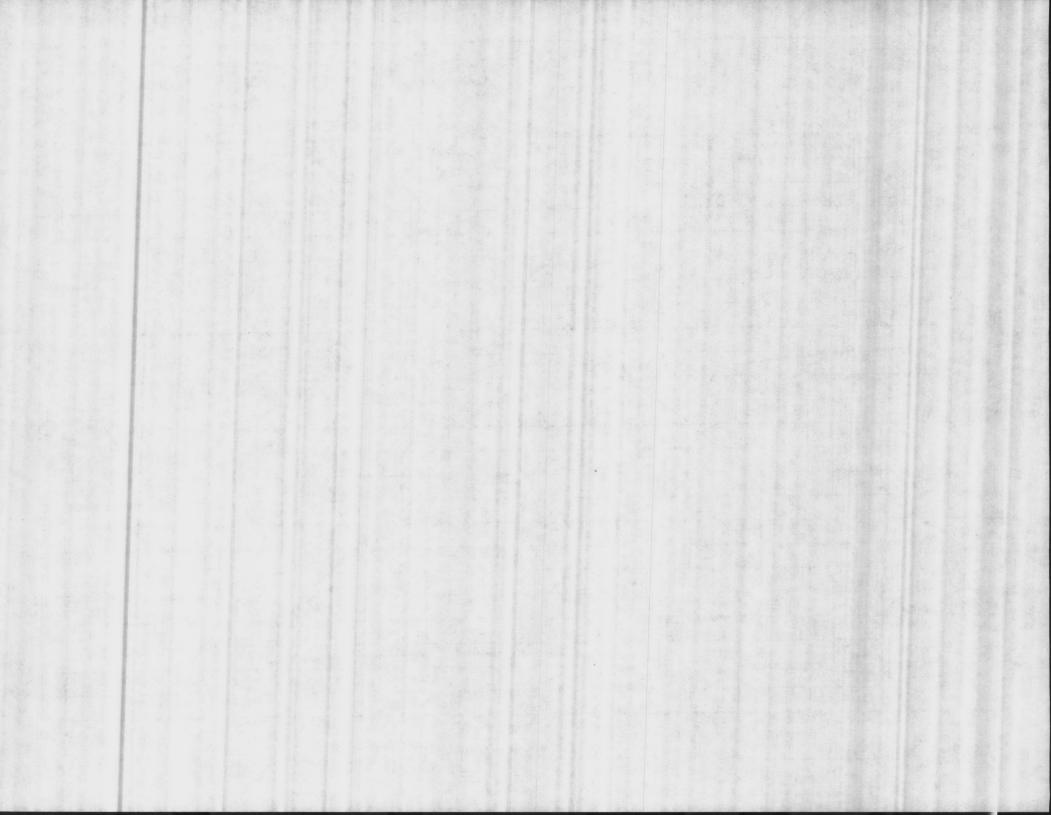

Very truly yours, HARRY PEPPER & ASSOCIATES, INC.

Phil Reese CQC Officer

RE: N62470-81-C-1644
Expansion of Holcomb Blvd.
Water Treatment Plant
Camp Lejeune, NC 28542
Well #1

Gentlemen:

We are enclosing six (6) copies of the Driller's Log, Electric Log, Gamma Log, Water Analysis and Sieve Analysis for your review. The test well was drilled at 250'. Water samples were taken at the 90' level.

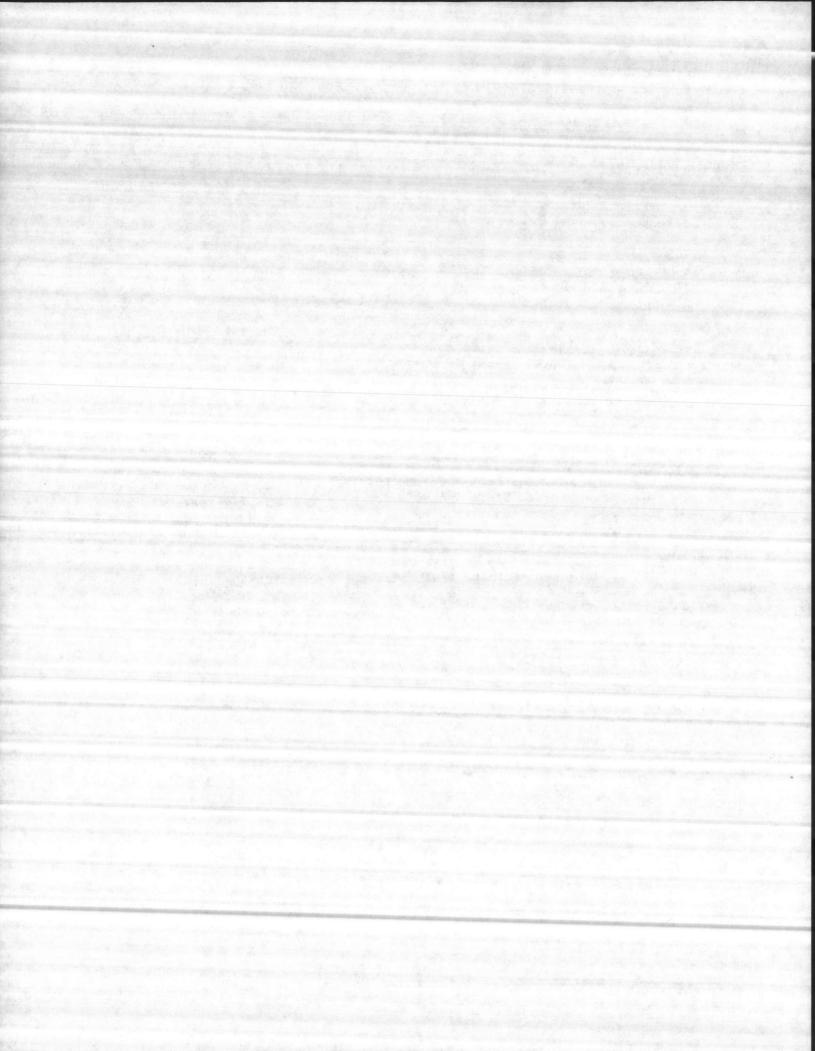

We recommend a line of .30-slot stainless steel screen set at the 78' to 98' level for a total of 20 VF of screen. The gravel pack recommended is 8-12. It is our best estimate that this well may yeild 260 GPM.

Please review the data and advise if we are to proceed with developing a permanent well at this site.

Very truly yours, HARRY PEPPER & ASSOCIATES, INC.

Phil Reese CQC Officer
