NREAD/EA8/th
6280/2
JAN 25 1983

Regional Administrator
Environmental Protection Agency
Region IV, Water Enforcement Branch
345 Courtland Street
Atlanta, Georgia 30309

Dear Sir:

In accordance with requirements of National Pollutant Discharge Elimination System (NPDES) Permit Number NC0003239, Discharge Monitoring Reports (DMRs) for the period September, October and November are submitted. The enclosed quarterly report was delayed due to computer problems Atlantic Division, Naval Facilities Engineering Command are having. As explained in a previous quarterly report dated 23 July 1982, the enclosed DMRs have been pen changed to reflect the data called for in the permit.

Hadnot Point Sewage Treatment Plant does not have the required 20 per month BOD samples for 1 September 1982 because of a laboratory problem shown by blank controls.

The storm drain violations depicted by the enclosed table may be correlated with base geography and facilities by referring to maps with numbered storm drain monitoring points that have been previously provided to your agency. Storm drains that are missing flow values had flows at the time of collection but it was not possible to determine the rate. Storm drains that have no values reported for the quarter were checked; however, each time they were checked, they were either dry or had no flow. The base environmental staff is continuing to work on operational control methodology to reduce oil and grease and suspended solids discharges.

For further pertinent details on any of the above, you may contact Mr. Julian Wooten, Natural Resources and Environmental Affairs Division, telephone (919) 451-5003/2083.

Sincerely,

J. T. MARSHALL
Colonel, U. S. Marine Corps
Assistant Chief of Staff, Facilities
By direction of the Commanding General

Atlanta, Georgia 30309

Dear Sir:

In accordance with requirements of National Pollutant Discharge Elimination System (NPDES) permit number NC0003239, discharge monitoring reports (DMRs) for the period June, July and August 1982 are submitted. Mr. Art Linton of your agency was advised on 30 September 1982 that the enclosed quarterly report would be delayed due to computer problems Atlantic Division, Naval Facilities Engineering Command were having in printing the DMRs. Also, as explained in the previous quarterly report dated 23 July 1982, the enclosed DMRs have been pen changed to reflect the data called for in the permit.

Camp Johnson Sewage Treatment Plant is missing one of the required two per week fecal coliform samples for the week of 13-19 June 1982, due to operator error. Hadnot Point Sewage Treatment Plant does not have the required five per week BOD samples for the weeks 6-12 and 20-26 June, 18-24 July and 8-21 August 1982 because of a laboratory problem shown by blank controls. Corrective action has been taken which appears to have eliminated the problem.

The storm drain violations depicted by the enclosed table may be correlated with base geography and facilities by referring to maps with numbered storm drain monitoring points that have been previously provided to your agency. Storm drains that have no values reported for the quarter were checked, however, each time they were checked, they were either dry or had no flow. The base environmental staff is continuing to work on operational control methodology to reduce oil and grease and suspended solids discharges.

For further pertinent details on any of the above, you may contact Mr. Julian Wooten, Natural Resources and Environmental Affairs Division, telephone (919) 451-5003/2083.

Sincerely,

J. T. MARSHALL
Colonel, U. S. Marine Corps
Assistant Chief of Staff, Facilities
By direction of the Commanding General

ENCLOSURE

NREA/eab

Regional Administrator
Environmental Protection Agency
Region IV, Water Enforcement Branch
345 Courtland Street
Atlanta, Georia 30309

Dear Sir:

Inaccoordance with requirements of National Pollutant Discharge Elimination System permit number NC0003239, discharge monitoring reports for the period June, July and August 1982 are submitted. This quarterly report was delayed due to the late return of July and August 1982 DMRs from Atlantic Division, Naval Facilities Engineering Command which prints the DMRs.

Paragraph 1, of effluent limitation and monitoring requirements for each outfall, under Part I of the NPDES permit number NC0003239 for Marine Corps Base, Camp Lejeune, requires weekly averages to be calculated for compliance of weekly average limits stated fpr the Biochemical Oxygen Demand(BOD), Suspended Solids and Fecal Coliform parameters. Paragraph 2,requires that the monthly percent removal of BODs and suspended solids shall be calculated by comparing monthly average influent to monthly average effluent. The enclosed DMRs, generated by Atlantic Divsion, Naval Facilities Engineering Command, computed the maximum weekly values for compliance with weekly average limits, and alos computed the average of the daily percent removals as the monthly percent removal. The anclosed DMRs have been pen changed to reflect the data called for in the permit.

Camp Johnson Sewage treatment plant is missing one out of the required two per week fecal coliform samples for the week of 13-19 June 1982, due to operator error, Hadnot Point sewage treatment plant does not have the required five per week BOD samples for the weeks 6-12,& 20-26 June, 18-24 Julyy and 8-21 August 1982 because of a laboratory peoblem. This caused Hadnot Point to only have 17BOD samples in June and 19 in Augast out of the required 20 samples/month. The problem shown by the blank controls in the

dilution water, used in the BOD analysis, that from time to time during the last four months has been unacceptable. Initially, the unsatisfactory dilution water was attributed to a bad demineralizer cartidge on the distiller used to produce the distilled water. The continued problem and further probing has shown that a new demineralizer requires a period of use before it provides satisfactory water. The laboratory is presently working out a schedule toaavoid the use of water from too old or new demineralizer cartidges, so as to eeduce the number of BOD samples lost.

The storm drain viola-tions depicted by the enclosed table may be correlated with base geography and facilities by referring to maps with numbered storm drains monitoring points that have been previously provided to your agency. Storm drains that have not values reported for the quarter were checked, however, each time they were checked, they were either dry or had no flow. The base environmental staff is continuing to work on operational control methodology to reduce oil and grease and suspended solids discharges.

For further pertinent details on any of thee above, you may contact Mr. Julian Wooten, Natural Resources and Environmnt Affairs, Telephone (919)451-5003/2083.

Date: 2 August 1982

From: Ms. Betz, Quality Control Lab., Environmental Section, NREAB, BMaintDiv

To: Mr. Sharpe, Supervisory Ecologist, Environmental Section, NREAB, BMaintDiv

Subj; Storm Drain Violations for July 1982

1. Storm Drains 39-47 and 49 were checked in July 1982. Storm Drains 39 and 40 were the only two not flowing. Below is a list of violations:

SD	Parameter	Limits	Value	Date
42	TSS	50 mg/l	220	20 Jul
47	pH	6.0-9.0	10.1	20 Jul

COMMENT AND EXPLANATION OF ANY VIOLATIONS (*Reference all attachments here*)

GENERAL INSTRUCTIONS

1. If form has been partially completed by preprinting, disregard instructions directed at entry of that information already preprinted.
2. Enter "PERMITTEE NAME/MAILING ADDRESS (and facility name/location, if different)," "PERMIT NUMBER," and "DISCHARGE NUMBER" where indicated. (A separate form is required for each discharge.)
3. Enter dates beginning and ending "MONITORING PERIOD" covered by form where indicated.
4. Enter each "PARAMETER" as specified in monitoring requirements of permit.
5. Enter "SAMPLE MEASUREMENT" data for each parameter under "QUANTITY" and "QUALITY" in units specified in permit. "AVERAGE" is normally arithmetic average (geometric average for bacterial parameters) of all sample measurements for each parameter obtained during "MONITORING PERIOD." "MAXIMUM" and "MINIMUM" are normally extreme high and low measurements obtained during "MONITORING PERIOD." (NOTE to municipals with secondary treatment requirement, enter 30-day average of sample measurements under "AVERAGE" and enter maximum 7-day average of sample measurements obtained during monitoring period under "MAXIMUM".
6. Enter "PERMIT REQUIREMENT" for each parameter under "QUANTITY" and "QUALITY" as specified in permit.
7. Under "NO. EX" enter number of sample measurements during monitoring period that exceed maximum (and/or minimum or 7-day average as appropriate) permit requirement for each parameter. If none, enter "0".
8. Enter "FREQUENCY OF ANALYSIS" both as "SAMPLE MEASUREMENT" (actual frequency of sampling and analysis used during monitoring period) and as "PERMIT REQUIREMENT" specified in permit. (e.g., Enter "CONT." for continuous monitoring, "1/7" for one day per week, "1/30" for one day per month, "1/90" for one day per quarter, etc.)
9. Enter "SAMPLE TYPE" both as "SAMPLE MEASUREMENT" (actual sample type used during monitoring period) and as "PERMIT REQUIREMENT." (e.g., Enter "GRAB" for individual sample, "24HC" for 24-hour composite, "N/A" for continuous monitoring, etc.)

FOLD HERE FIRST

10. WHERE VIOLATIONS OF PERMIT REQUIREMENTS ARE REPORTED, ATTACH A BRIEF EXPLANATION TO DESCRIBE CAUSE AND CORRECTIVE ACTIONS TAKEN, REFERENCE EACH VIOLATION BY DATE.
11. If "no discharge" occurs during monitoring period, enter "NO DISCHARGE" across form in place of data entry.
12. Enter "NAME/TITLE OF PRINCIPAL EXECUTIVE OFFICER" with "SIGNATURE OF PRINCIPAL EXECUTIVE OFFICER OR AUTHORIZED AGENT," "TELEPHONE NUMBER" and "DATE" at bottom of form.
13. Mail signed Report to Office(s) by date(s) specified in permit. Retain copy for your records.
14. More detailed instructions for use of this DISCHARGE MONITORING REPORT (DMR) form may be obtained from Office(s) specified in permit.

LEGAL NOTICE

This report is required by law (33 U.S.C. 1318; 40 C.F.R. 125.27). Failure to report or failure to report truthfully can result in civil penalties not to exceed $10,000 per day of violation; or in criminal penalties not to exceed $25,000 per day of violation, or by imprisonment for not more than one year, or by both.

"MAXIMUM" and "MINIMUM" are normally extreme high and low measurements obtained during "MONITORING PERIOD." (NOTE to municipals with secondary treatment requirement, enter 30-day average of sample measurements under "AVERAGE" and enter maximum 7-day average of sample measurements obtained during monitoring period under "MAXIMUM".
6. Enter "PERMIT REQUIREMENT" for each parameter under "QUANTITY" and "QUALITY" as specified in permit.
7. Under "NO. EX" enter number of sample measurements during monitoring period that exceed maximum (and/or minimum or 7-day average as appropriate) permit requirement for each parameter. If none, enter "0".
8. Enter "FREQUENCY OF ANALYSIS" both as "SAMPLE MEASUREMENT" (actual frequency of sampling and analysis used during monitoring period) and as "PERMIT REQUIREMENT" specified in permit. (e.g., Enter "CONT." for continuous monitoring, "1/7" for one day per week, "1/30" for one day per month, "1/90" for one day per quarter, etc.)
9. Enter "SAMPLE TYPE" both as "SAMPLE MEASUREMENT" (actual sample type used during monitoring period) and as "PERMIT REQUIREMENT." (e.g., Enter "GRAB" for individual sample, "24HC" for 24-hour composite, "N/A" for continuous monitoring, etc.)

FOLD HERE FIRST

---

10. WHERE VIOLATIONS OF PERMIT REQUIREMENTS ARE REPORTED, ATTACH A BRIEF EXPLANATION TO DESCRIBE CAUSE AND CORRECTIVE ACTIONS TAKEN. REFERENCE EACH VIOLATION BY DATE.
11. If "no discharge" occurs during monitoring period, enter "NO DISCHARGE" across form in place of data entry.
12. Enter "NAME/TITLE OF PRINCIPAL EXECUTIVE OFFICER" with "SIGNATURE OF PRINCIPAL EXECUTIVE OFFICER OR AUTHORIZED AGENT," "TELEPHONE NUMBER" and "DATE" at bottom of form.
13. Mail signed Report to Office(s) by date(s) specified in permit. Retain copy for your records.
14. More detailed instructions for use of this DISCHARGE MONITORING REPORT (DMR) form may be obtained from Office(s) specified in permit.

LEGAL NOTICE

This report is required by law (33 U.S.C. 1318; 40 C.F.R. 125.27). Failure to report or failure to report truthfully can result in civil penalties not to exceed $10,000 per day of violation; or in criminal penalties not to exceed $25,000 per day of violation, or by imprisonment for not more than one year, or by both.

GENERAL INSTRUCTIONS

1. If form has been partially completed by preprinting, disregard instructions directed at entry of that information already preprinted.
2. Enter "PERMITTEE NAME/MAILING ADDRESS (and facility name/location, if different)," "PERMIT NUMBER," and "DISCHARGE NUMBER" where indicated. (A separate form is required for each discharge.)
3. Enter dates beginning and ending "MONITORING PERIOD" covered by form where indicated.
4. Enter each "PARAMETER" as specified in monitoring requirements of permit.
5. Enter "SAMPLE MEASUREMENT" data for each parameter under 'QUANTITY" and "QUALITY" in units specified in permit. "AVERAGE" is normally arithmetic average (geometric average for bacterial parameters) of all sample measurements for each parameter obtained during "MONITORING PERIOD." "MAXIMUM" and "MINIMUM" are normally extreme high and low measurements obtained during "MONITORING PERIOD." (NOTE to municipals with secondary treatment requirement, enter 30-day average of sample measurements under "AVERAGE" and enter maximum 7-day average of sample measurements obtained during monitoring period under "MAXIMUM".
6. Enter "PERMIT REQUIREMENT" for each parameter under "QUANTITY" and "QUALITY" as specified in permit.
7. Under "NO. EX" enter number of sample measurements during monitoring period that exceed maximum (and/or minimum or 7-day average as appropriate) permit requirement for each parameter. If none, enter "0".
8. Enter "FREQUENCY OF ANALYSIS" both as "SAMPLE MEASUREMENT" (actual frequency of sampling and analysis used during monitoring period) and as "PERMIT REQUIREMENT" specified in permit. (e.g., Enter "CONT." for continuous monitoring, "1/7" for one day per week, "1/30" for one day per month, "1/90" for one day per quarter, etc.)
9. Enter "SAMPLE TYPE" both as "SAMPLE MEASUREMENT" (actual sample type used during monitoring period) and as "PERMIT REQUIREMENT." (e.g., Enter "GRAB" for individual sample, "24HC" for 24-hour composite, "N/A" for continuous monitoring, etc.)

Date: 4 November 1982

Memorandum for the Record

From: Ms. Betz, Quality Control Lab, Environmental Br, NREAD, Facilities

Subj: 28 October 1982 Briefing with Colonel J. T. Marshall AS/C Facilities

1. On 28 October 1982, Julian Wooten and Elizabeth Betz went to Bldg 1 to brief the assistant chief of staff-Facilitfes, Col. Marshall, on the June-August 1982 NPDES Quarterly Report. Col Fritzgerald was also present. The report was submitted to Col. Marshall for his signature and release.

2. Col Marshall inquired about the reasons for missing data. The operator error for the coliform sample was easily explained, do to an operator forgetting to take the sample or the sample still having chlorine present when received by the lab. The missing BOD samples were explained by the new still, with a demineralizer that is using up cartidges at a much greater rate. And that an old and a brand new cartidge produces unsatisfactory water for the BOD analysis. I expained that a schedule was being worked out to alternate between the two stills to avoid using bad water.

3. Col. Marshall inquired into the storm drain violations. First, I pointed out the overlap of storm drain quarters and sewage plant quarters; an NPDES permit will have the last month of one quarter of storm drains and the first monthonths of the next quarter.ofHe had inquired as to the frequency of these violations. I pointed out that 42 and 47 were repeated violators and their point source is the main Steam Plant and Coal Pile. As for the others, I stated they were not repeated violators and that I was not sure of their frequency. I also stated that with P996 the list of violations had reduced abd that a good portion of our 71 storm drains are drying up or at least not flunking.

4. Col Marshall signed the eeport. He was assured that the reason for its delay was LANTDIV and not oars However I failed to point out ahd explain the pen changes. Since the cover letter did not go into them I for got oo.

5. With the quarterly report aside, the Colonel brought up the question 66 how accurate the sampling is. Of course, when the operators in charge of operating are taking the samples, the question of forging samples always exists. I pointed out that occasional odd high flows have been seen and chlorine has been found 1 where it shouldn't be. I also stated that the sewage samples have greatly improved during the past year, do to the efforts of the sewage foreman.

6. Next thing brought up was the possibility of spot checking.. I stated that since most samples were composited, automatic samplers could be used for spot checking. The time element of traveling and transporting the sample(s) was brought up. I also stated that we had an automatic sampler. The Colonel stated that he wanted to see some spot checking. During a phone conversation held later that day with Mr. Davis, Mack stated he had no problems with the spot checks. Examination of our Isco composite sampler shows that flow proportioning can not be done. also electrical service has to be provided until a new battery pack can be obtained.

7. The Colonel then raised the question about the Lab taking over sampling. He wants manpower and costs prepared. I stated automatic samplers would be required.

Date: 4 November 1982

8. The final area coverdd was PCBs and Equipment needed. Col Marshall inquired as to the capacity for PCB analysis by the lab at present. I explained the flame test. He directed us to go out to Piney Green Rd and see what we could do and do it.

9. The Colonel then asked what would be needed to run PCBs. I stated a gas chromatograph, which could also run THMs and other organic analysis, at a costof at least $12,000. I then added that THM analysis cost $25/sample at 5 samples/pl plann and FY82's contract ran over $3,000 ($5,000 to be exact). I also added that a gas chromagraph required continuous electrical power, ~~weeks~~ as in emergency generator for power outages, since it takes weeks to recalibrate. Also for pooper care it should be kept at a constant temperature renge, which presently the lab is not. Mr. Wooten mentioned the plans and money presently in the system to put the lab on its own heating and cooling system.

10. The Colonel stated he was still planning to visit the laboratory.

Elizabeth A. Betz
Supervisory Chemist

NPDES FILE

Date: 4 November 1982

Memorandum for the Record

From: Ms. Betz, Quality Control Lab, Environmental Se, NREAD, Facilities

Subj: Sewage Operational Testing at Hadnot Point with Chlorine Residuals

Encl: (1) 26 October 1982 Results
(2) 27 October 1982 Results

1. Background: In 1979, during LANTDIV's Environmental Survey, it was recommended that MCBCL Sewage Treatment Plants reduce their chlorine residuals. In the summer of 1981, the coliform counts increased so the chlorine residuals were raised. In preparation of the 1982 survey, Fred Cone, present Utilities Director, called for some testing and results to support the fact that 1.0-2.0ppm chlorine residuals would not kill bacteria sufficiently at MCBCL.

2. On 26 October 1982, Mack Davis, foreman at the Sewage Treatment Plants, under Fred Cone's orders, instructed his operators on the 12-8 shift to reduce the chlorine level to 1.0ppm in the contact chamber. When the chlorine reached 1.0ppm a bacteria sample was taken. The chlorine was then raised to 2.0ppm and a sample taken, then to 3.0ppm and 4.0ppm.

3. The four bacteria samples were brought to the Quality Control Lab for analysis. Enclosure (1) is a copy of the lab results. Below is a table summarizing the results.

Time	Chlorine Residual(ppm)	Total Coliform(/100ml)
3:45	1.0	4,000
5:15	2.0	86
5:45	3.0	50
6:30	4.0	46

4. Do to the closeness of the 2.0-4.0ppm samples further testing was done, on 27 October 1982, by Mack Davis, Elizabeth Betz, and Gaines Huneycutt. This time to prevent any further pollution in the river, testing was done using jars instead of the contact chamber. Samples were pulled off the secondary clarifier, just before the contact chamber. A saturated solution of HTH was prepared and used to chlorinate the rest of the samples. Chlorination was done by hit and miss since the chlorien demand was unknown. The first chlorien residual obtained was 2.0ppm, that jar was setaside and bacteria samples were pulled every ten minutes, for thirty minutes. At thirty minutes a final chlorine residual was taken, it had dropped to 1.5ppm. The second chlorine residual reached was 4.0ppm. It was set aside and bacteria samples pulled, its final chlorine residual readingswas also 4.0ppm. The third was 1.0ppm with its final reading at 0.8ppm. The last chlorine residual reached was 3.0ppm and its final reading was 2.5ppm.

5. The samples were brought back to the lab and three dilutions(50 ml, 10 ml, 0.1 ml) for Total Coliform and two dilutions(50 ml, 100 ml) for Fecal Coliform were run. The samples were run in order of the highest chlorine residual and longest contact time to shortest contact time, same chlorine level, to next highest chlorine residual and so on (4.0ppm30min, 400ppm20min,...1.0ppm10min). Complete results are shown on Enclosure (2). Below is a summary.

Cl_2 Res	Total 10 min	Total 20 min	Total 30 min	Fecal 10 min	Fecal 20 min	Fecal 30 min
1.0	TNTC	50,000	15,000	400	34	8
2.0	50,000	3,000	20	20	6	2
3.0	24	2	0*	0	0	0
4.0	750	10	0	46	2	0

The 3.0ppm30min(50ml dilution) plate yeilded 24 colonies, mostly likely non-coliform, that were under strees.

6. These results show that 1.0-2.0ppm chlorine could no kill all the bacteria

Elizabeth A. Betz
Supervisory Chemist

UNITED STATES MARINE CORPS
MARINE CORPS BASE
CAMP LEJEUNE, NORTH CAROLINA 28542

IN REPLY REFER TO
MAIN/DDS/spk
6280/2
23 Jul 1982

Regional Administrator
Environmental Protection Agency
Region IV, Water Enforcement Branch
345 Courtland Street
Atlanta, Georgia 30309

Dear Sir:

In accordance with requirements of the National Pollutant Discharge Elimination System (NPDES) permit number NC0003239, Discharge Monitoring Reports (DMRs) for the period March, April and May 1982 are submitted. This quarterly report was delayed due to the late return of May 1982 DMRs from Atlantic Division, Naval Facilities Engineering Command which prints the DMRs.

Paragraph 2, of effluent limitation and monitoring requirements for each outfall, under Part I of the NPDES permit number NC0003239 for Marine Corps Base, Camp Lejeune, requires that the monthly percent removal of BODs and suspended solids shall be calculated by comparing monthly average influent to monthly average effluent. The enclosed DMRs, generated by Atlantic Division, Naval Facilities Engineering Command, computes the average of the daily percent removals as the monthly percent removal. The enclosed DMRs have been pen changed to reflect the calculation method called for in the permit.

The Courthouse Bay sewage treatment plant BOD percent removal violation for May 1982 and BOD weekly effluent average violation for the week of 23 May 1982 appeared to be the result of oxygen demand of a reddish substance present in influent on 25 May 1982. Base personnel were not able to identify the substance nor its source. Sampling and laboratory errors are the cause for missing BOD and total coliform values for the Hadnot Point sewage treatment plant in May 1982. Sampling errors which occurred during the collection of the 4 May 1982 unchlorinated BOD effluent sample and the 11 May 1982 coliform sample resulted in discarding both samples due to chlorine contamination. Laboratory errors involving the 18, 27 and 29 May 1982 BOD samples were identified when dilution water used in these samples was shown by the blank controls to be unacceptable. The cause for the unsatisfactory dilution water was determined to be a bad demineralizer cartridge on the distiller used to produce distilled water.

The storm drain violations depicted by the enclosed table may be correlated with base geography and facilities by referring to maps with numbered storm drain monitoring points that have been previously provided to your agency. Storm drains that have no values reported for the quarter were checked, however, each time they were checked, they were either dry or had no flow. The base environmental staff is continuing to work on operational control methodology to reduce oil and grease and suspended solids discharges.

MAIN/DDS/spk
6280/2

For further pertinent details on any of the above, you may contact Mr. Julian Wooten, Natural Resources and Environmental Affairs Branch, Base Maintenance Division, telephone (919) 451-5003/2083.

Sincerely,

R. F. CALTA
Lieutenant Colonel, U. S. Marine Corps
Base Maintenance Officer
By direction of Commanding General

Dear Sir:

In accordance with requirements of National Pollutant Discharge Elimination System permit number NC0003239, discharge monitoring reports for the period March, April, and May 1982 are submitted. This quarterly report was delayed due to the late return of May 1982 DMRs from Atlantic Division, Naval Facilities Engineering Command, which feeds the wastewater data into a computor and prints the DMRs for Marine Corps Base, Camp Lejeune.

Paragraph 2, of effluent limitation and monitoring requirements for each outfall, under Part I of National Pollutant Discharge Elimination System permit number NC0003239 for Marine Corps Base, Camp Lejeune, requires that the monthly percent removal of BODs and suspended solids shall be calculated by comparing monthly average influent to monthly average effluent. This quarterly report was initially computed by a new program developed by Atlantic Division, Naval Facilities Engineering Command, which computes the average of the daily percent removals as the monthly percent removal. The pen changes reflect the correct monthly percent removal called for in the permit.

The Courthouse Bay sewage treatment plant BOD percent removal violation for May 1982 and BOD weekly effluent average violation for the week of 23 May 1982 can be attributed to a reddish substance that entered the plant on 25 May 1982. The substance is suspected of causing the 56 mg/l BOD effluent recorded for that day. The 25 May 1982 samples were the only BOD samples for that week and therefore violated the 45 mg/l weekly effluent average and caused a monthly average percent removal of 79.3. An investigation as to the source and idenity of the substance has not been fruitful.

Sampling and laboratory errors are the cause for missing BOD and Total Coliform values for the Hadnot Point sewage treatment plant in May 1982. Sampling errors occurred on 4 May 1982, while collecting the unchlorinated BOD effluent sample and on 11 May 1982, while collecting the coliform sample. Both samples were chacked at the lab and were found invalid due to the presence of chlorine. Laboratory errors occurred when the 18,27 and 29 May 1982 BOD samples were analyzed. The dilution water used in these samples was shown by the blank controls to be unacceptable. The cause for the bad dilution water was later attributed to a bad demineralizer cartridge on the distiller.

The storm drain violations depicted by the enclosed table may be correlated with base geography and facilities by referring to maps with numbered storm drains monitoring points that have been previously provided to your agency. Oily waste discharge violations are directly related to runoff from the areas with wash racks, grease racks, and maintenance areas. The major contributing factors to the presence of oily waste discharge on storm drains are due to inadequate abatement facilities. Concentrations of suspended solids that violate permit limitations may be directly attributed to runoff from roads and grounds. Storm drains that have no values reported for the quarter were checked, however, each time they were checked they were either dry or had no flow.

The base environmental staff is continuing to work on operational control methodology to reduce suspended solids discharges. An A&E firm has designed facilities to abate miscellaneous pollution discharges. The construction contract has been awarded and the estimated date of construction completion for full treatment of miscellaneous pollution sources is May 1983.

For further pertinent details on any if the above, you may consact Mr. Julian Wooten, Natural Resources and Environmntal Affairs Branch, Base Maintenance Divi-

To: Quality Control Lab

Subj: Courthouse Bay Permit Violation

1. On 25 May 1982 the operator on duty at Courthouse Bay reported that a reddish substance was entering the plant influent. At 1130 a.m. I instructed him to take samples as normal, and to run a settleable solids test on the influent. The operator did this and recorded 10 mg/L. At about 1230, he checked the chlorine residual and had to increase the dosage from 45 to 65 pounds per day to obtain a 2.0 residual. The BOD for 25 May 1982 was 80 influent, 56 effluent, for 30% removal which lowered the monthly average removal to 79.3, violating the permit limits.

2. Investigation as to source of substance and idenity has not been fruitful.

MACK D. DAVIS, JR.

MAIN/DDS/th

Regional Administrator
Environmental Protection Agency
Region IV, Water Enforcement Branch
345 Courtland Street
Atlanta, Georgia 30309

Dear Sir:

In accordance with requirements of National Pollutant Discharge Elimination System permit number NC0003239, discharge monitoring reports for the period December 1981, January and February 1982 are submitted. This quarterly report was delayed due to computer problems, as was discussed by Mr. Danny Sharpe and Ms. Elizabeth Betz, Base Maintenance Division, and Mr. Jim Holdaway of your office on 31 March 1982.

Paragraph 2, of effluent limitation and monitoring requirements for each outfall, under Part I of National Pollutant Discharge Elimination System permit number NC0003239 for Marine Corps Base, Camp Lejeune, requires that the monthly percent removal of BODs and suspended solids shall be calculated by comparing monthly average influent to monthly average effluent. This quarterly report was computed by a new program developed by Atlantic Division, Naval Facilities Engineering Command, which computes the average of the daily percent removals as the monthly percent removal. On 8 April 1982, Mr. Holdaway advised that either of the two methods for making the calculations were acceptable to the Environmental Protection Agency.

The Courthouse Bay sewage treatment plant BOD percent removal violation for the month of December 1982 can be attributed to a shaft that broke on a filter feed pump and was overhauled during the month which resulted in sparadic feeding to the filter.

The Camp Johnson sewage treatment plant BOD percent removal violations for the months of January and February 1982 can be attributed to the filter being out twice for maintenance and repairs for a total of about two and one-half weeks in January 1982. The growth on the filter subsequently died and therefore it has taken some time for it to recover.

The discharge monitoring reports show no values for BOD for the Rifle Range, Courthouse Bay and Onslow Beach sewage treatment plants (SS 15-17/05-07) for the last week in February 1982, and three BOD values missing for the Hadnot Point sewage treatment plant (SS 14/04) that same month. A laboratory error occurred when reading the five-day dissolved oxygen for all seven sewage treatment plant samples collected on 23 and 25 February 1982 and the Hadnot Point sewage treatment plant sample collected on 26 February 1982.

MAIN/BDS/th
6280/2

The storm drain violations depicted by the enclosed table may be correlated with base geography and facilities by referring to maps with numbered storm drain monitoring points that have been previously provided to your agency. Oily waste discharge violations are directly related to runoff from areas with wash racks, grease racks and maintenance areas. The major contributing factors to the presence of oily waste discharge in storm drains are due to inadequate abatement facilities. Concentrations of suspended solids that violate permit limitations may be directly attributed to runoff from roads and grounds. Storm drains that have no values reported for the quarter were checked, however, each time they were checked they were either dry or had no flow.

The base environmental staff is continuing to work on operational control methodology to reduce suspended solids discharges. An A&E firm has designed facilities to abate miscellaneous pollution discharges. The construction contract has been awarded and the estimated date of construction completion for full treatment of miscellaneous pollution sources is May 1983.

For further pertinent details on any of the above, you may contact Mr. Julian Wooten, Natural Resources and Environmental Affairs Branch, Base Maintenance Division, telephone (919) 451-5003/2083.

Sincerely,

B. W. ELSTON
Acting Base Maintenance Officer
By direction of the Commanding General

SD 43	O&G	15 mg/1	19.3	1 February 1982
SD 65	SS	50 mg/1	102	1 February 1982

Dear Sir:

In accordance with requirements of National Pollutant Discharge Elimination System permit number NC0003239, discharge monitoring reports for the period December 1981, January and February 1982.are submitted.

The reason for the delay of this quareerly report was due to computor problems, as was discussed during a FONCON between Mr. Danny Sharpe and Ms. Elizabeth Betz, BMaintDiv, MCB CAMP LEJRUNE, and Mr. Jim Holloway of your office on 31 March 1982. At that time, Mr. Holloway was also informed of the three sewage treatment plant BOD percent removal violations.

Paragraph 2, of effluent limitation and monitoring requiremants for each outfall, under Part I of NPDES Permit No. NC0003239 for MCB Camp Lejeune, specifically require that the monthly percent removal of BODs and suspended solids shall be calculated by comparing monthly average influent to monthly average effluent. However this quarterly report, computed by Atlantic Division, Naval Facilities Engineering Command, shows tha average of the daily percent removals as the monthly percent removal. During a FONCON, on 8 April 1982, between Ms. Elizabeth Betz and Mr. Jim Holloway this problem was preeented, since the two different calculations yield two different answers,

The Courthouse Bay Sewage Treatment Plant BOD % Removal violation for the month of December 1981 can be attributed to a shaft that broke on a filter feed pump and was overhauled during the month which resulted in sparadic feeding to the filter.

The Camp Johnson Sewage Treatment Plant BOD % Removal Violations for the months of January and February 1982 can be attributed to the filter being out twice for maintenanaeeand repairs for a total of about 2½ weeks in January 1982. The growth

Close study of the discharge monitoring reports will show no values for BOD for the Rifle Range, Courthouse Bay,,and Onslow Beach Sewage Treatment Plants(SS15-17/05-07) for the last week in February 1982, and three BOD values missing for the Hadnot Point Sewage Treatment Plant(SS14/04) that same month. A laboratory error occurred when reading the 5-day dissolved oxygen for all seven sewage treatment plant samples collected on 23 and 25 February 1982, and also for the Hadnot Point Sewage Treatment Plant sample collected on 26 February 1982, which caused the lost of those values.

The Storm Drains violations depicted by the enclosed table may be correlated with base geography and facilities by referring to maps with numbered storm drain monitoring points that have been previously provided to your agency. Oily waste discharge violations are directly related to runoff from areas with wash racks, grease racks, and maintenance areas. The major contributing factors to the presnace of oily waste discharge in storm drains os due to inadequate abatement facilities. Concentrations of suspended solids that violate permit limitations may be directly attributed to runoff from roads and grounds. Storm Drains that have no values reported for the quareer were checked, however, each time they were chekked they were either dry or had no flow.

The base environmental staff is continuing to work on operational control methodology to reduce suspended solids discharges. An A & E firm has designed facilities to abate miscellaneous pollution discharges. The construction contract has been awarded and the estimated date of construction completion for full treatment of miscellaneous pollution sources is

Subj: Failure of B.O.D. at Camp Johnson Sewage Treatment Plant for the month of January and February 1982

1. The filter at Camp Johnson Sewage Treatment Plant was out for five days the first of January for maintenance and repair. When we put the filter back in operation, it ran for about two weeks and the center column bearing went out (was out for about 1½ weeks). The growth on the filter died, causing the failure of B.O.D. for the months of January and February.

P. S. HUFFMAN, JR.
